

# SuperSeal Connectors

## Exploded view of assemblies

The screws used are #2 1/2" Long RoundHead Philips Thread-Forming BlackZincPlated screws, McMaster-Carr 92295A113 at a cost of \$7.78(50).

# AMP Superseal 1.5 Series Connectors

The connectors used in these shells are commonly available automotive connectors. The purpose of the 3D printed shells is to provide extra protection for ruggedized connectors as well as “keying” options. For example, multiple connectors with the same number of conductors, can be keyed so pairs cannot be switched.

These connectors can be difficult to assemble at first, but between the following instructions in this document and plentiful on on-line documents and videos, there is thorough information for guidance.

## AMP SUPERSEAL 1.5 Series Connectors

for the Automotive Industry

### AMP SUPERSEAL 1.5 Series Connectors Cap Housings

Cap Housings (utilizes Tab Contacts)

1 to 6 positions

#### Technical Features

**Contact Finish:**  
Tin plated, gold plated

**Current Carrying Capacity:**  
14 A max.

**Wire Size Range:**  
0.35 – 2.5 mm<sup>2</sup>

**Extraction Tool:**  
Part No. 9-1579007-1

**Product Specification:**  
108-20090

**Application Specification:**  
114-20045

### AMP SUPERSEAL 1.5 Series Connectors Plug Housings

Plug Housings (utilizes Receptacle Contacts)

1 to 6 positions

#### Technical Features

**Contact Finish:**  
Tin plated

**Current Carrying Capacity:**  
14 A max.

**Wire Size Range:**  
0.35 – 2.5 mm<sup>2</sup>

**Insulation Diameter:**  
1.2 – 3.3 mm FLR

**Extraction Tool:**  
Part No. 9-1579007-1

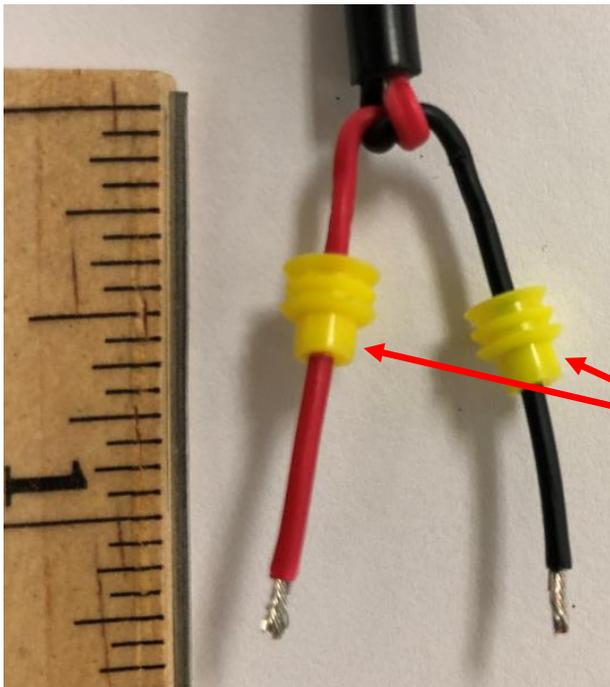

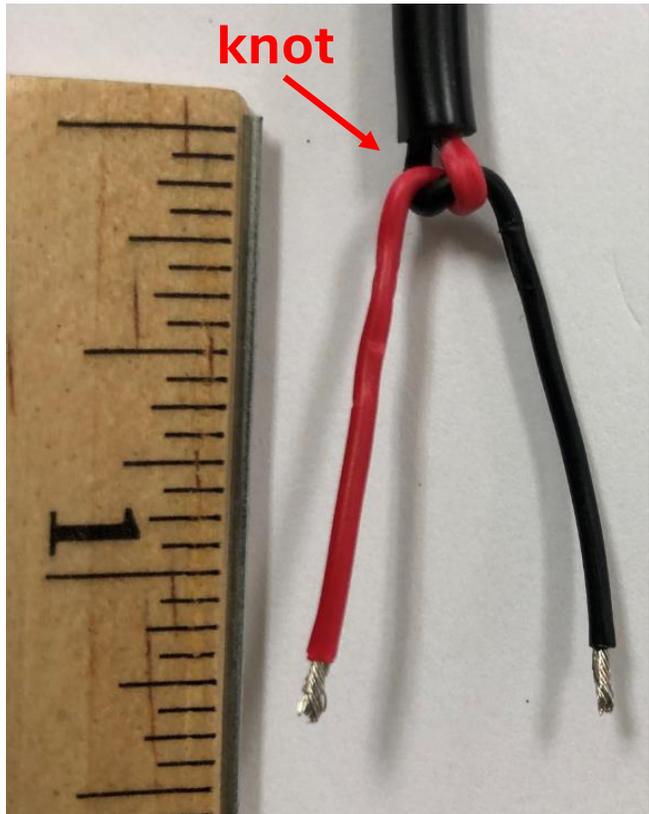

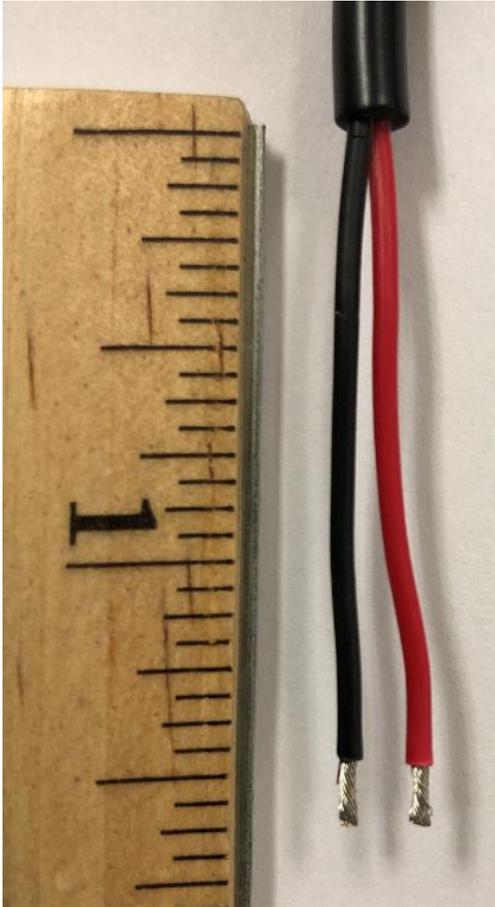

**Product Specification:**  
108-20090

**Application Specification:**  
114-20045

## Installing connectors – preparing cable

- 1) remove 1.625" of cable outer sheathing and 0.125" of insulation
- 2) make a tight knot close to the outer cable sheathing
- 3) place the silicone seals on the conductors

**The smaller diameter section points towards the wire ends.**

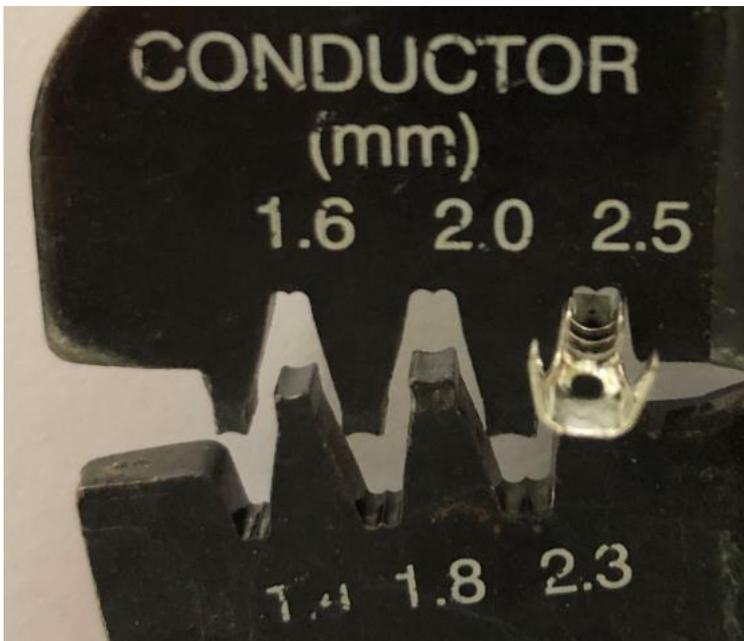

# Installing connectors – crimping tab terminals

The terminals have two sections that are crimped differently. The 1st section, which is closest to the pin or socket end, is crimped on the bare wire. The 2nd section, which is larger, is crimped on the insulation.

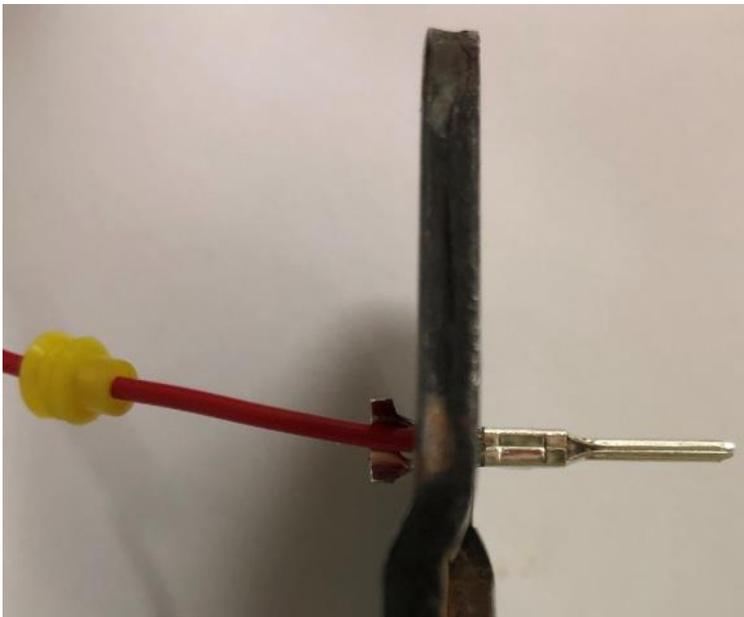

**Crimping wires properly is difficult and it is highly recommended to practice on test wire at first. After about 20 years of crimping, one starts to get the hang of it.**

**At the end of this document see “Good Crimp Quality” and “Incorrect Crimp Quality”.**

- 1) place the bare wire section in the 2.5mm crimper position as shown
- 2) insert the bare wire into that section
- 3) squeeze the crimper

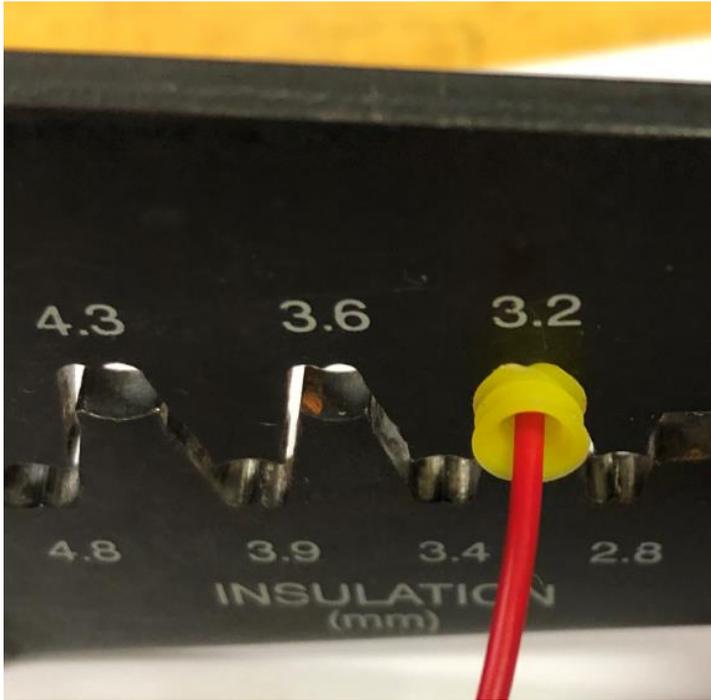

**Front view**

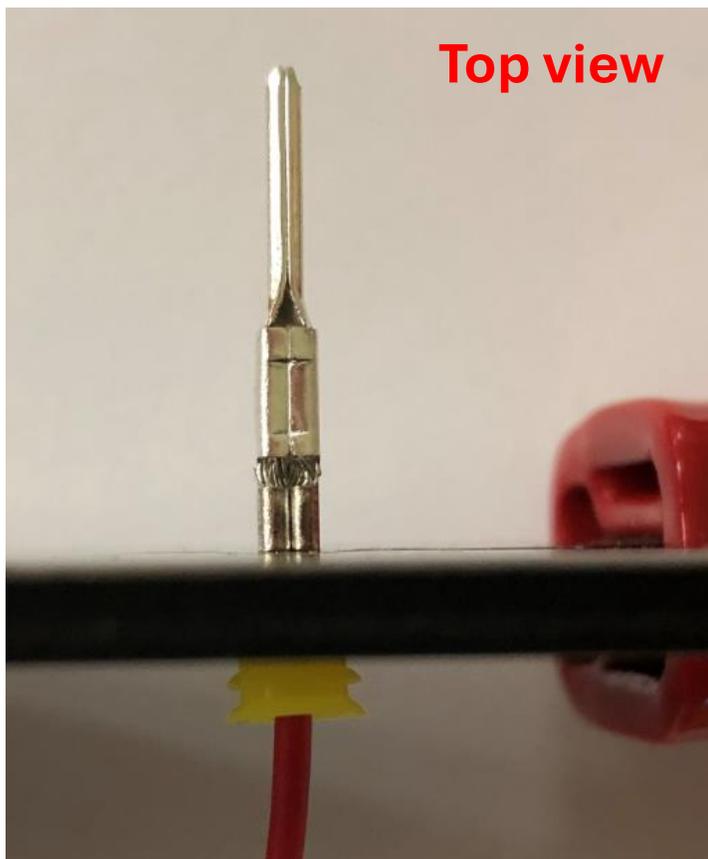

**Top view**

- 4) move the silicone seal so that its smaller diameter end is in the larger crimp section
- 5) place the bare wire section in the 3.2mm crimper position as shown
- 6) squeeze the crimper

**Front view**

**Result of properly crimped tab terminals**

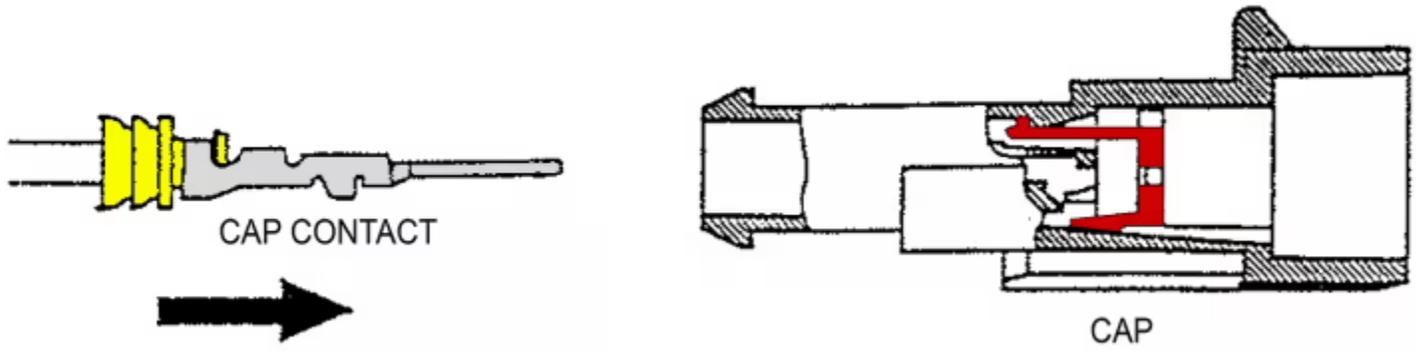

**Top view**

# Installing connectors – inserting terminals into shells

1) insert the terminals into the shell. There should be a click when they lock in place and they should stay in place with a slight tug on a wire. Note the orientation of the tab contact and the cap housing.

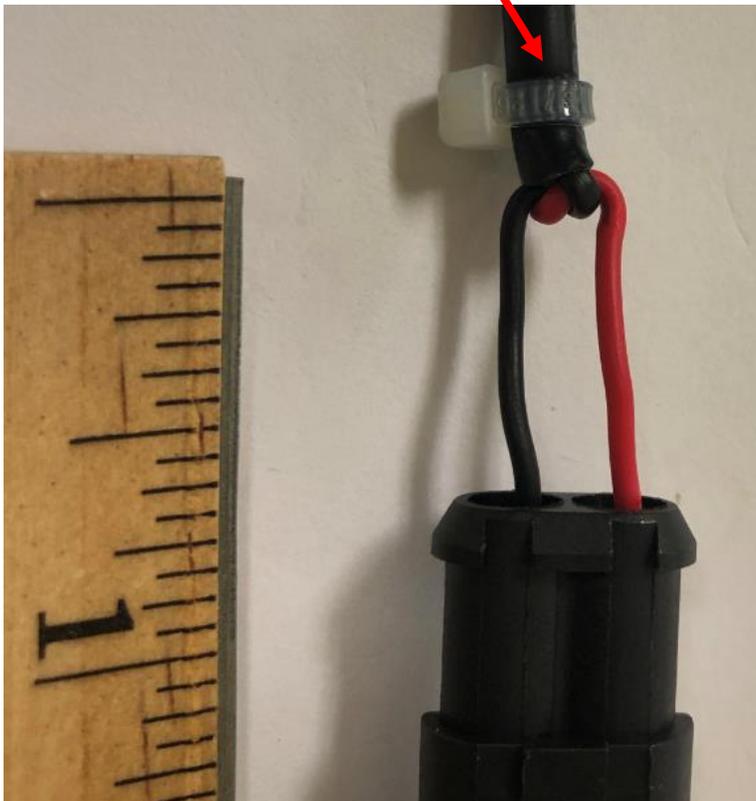

2) add a small 2mm wide cable tie on the cable outer sheathing just above the knot

3) place the connector, wires, and cable tie into the lower shell

The cable tie should be **in the shell** to prevent the cable from being pulled out.

**Cable tie**

## Installing connectors – adding label

- 1) for waterproof labels cover both surfaces or the label with tape or apply an acrylic clear spray
- 2) cut the label to size and add double stick tape to the underside
- 3) place the top shell over the lower shell and wires
- 4) attach the label to the top shell without applying pressure
- 5) place the bezel over the label and adjust the label position as needed
- 6) press down firmly to ensure the double-stick tape adheres well
- 7) insert #2 self tapping screws

## Installing connectors – crimping receptacle terminals

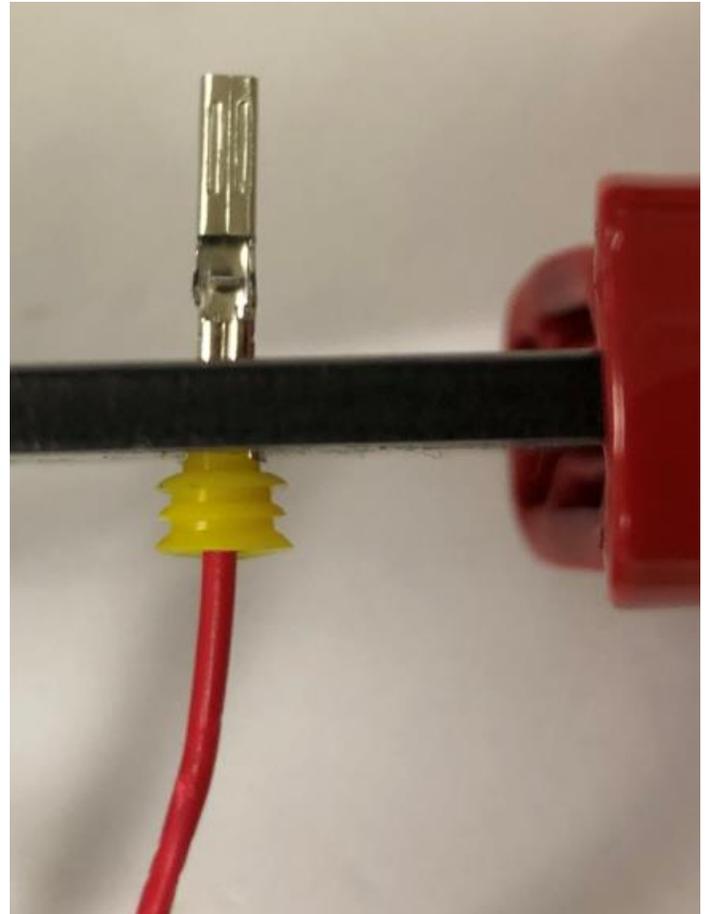

The previous sections provide instructions for crimping and installing **tab (pin) terminals**. This section is concerned with **socket terminals**.

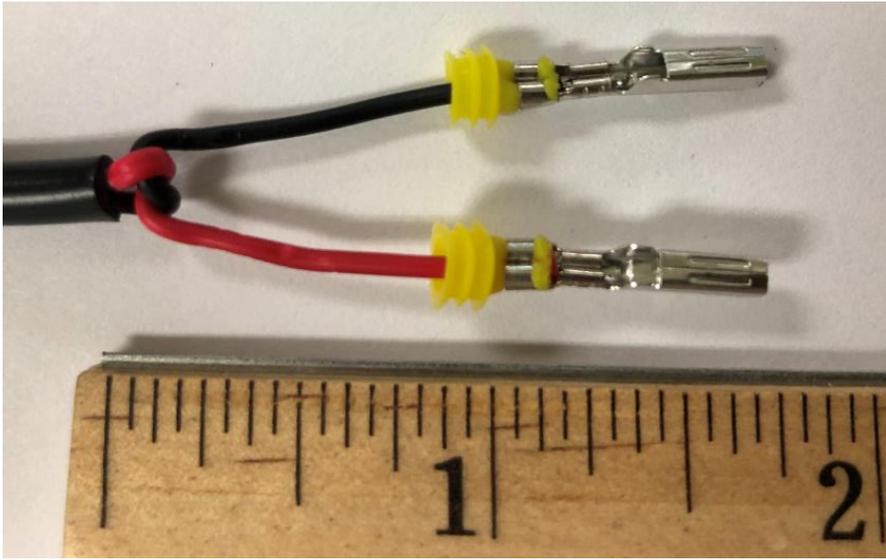

The crimping method and positions used on the crimper are the same and thus fewer photos will be presented.

Here the **bare wire** is being crimped using the **2.5 position** on the crimper.

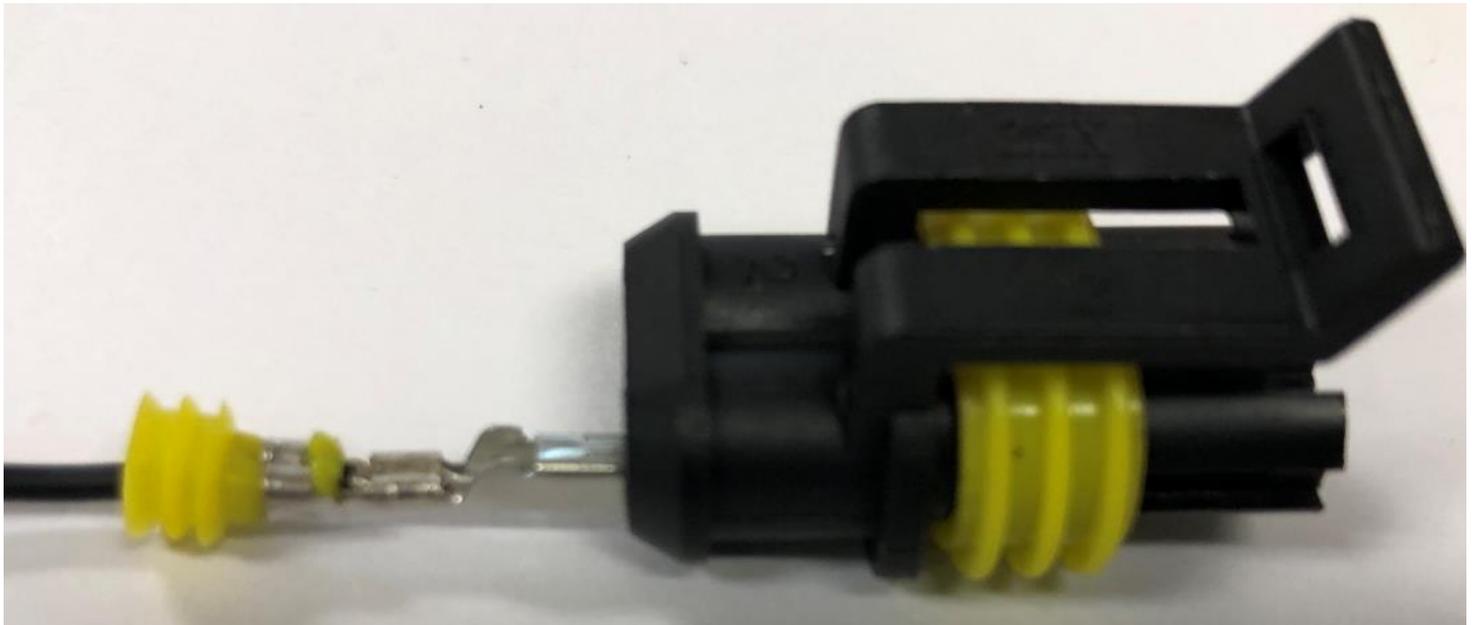

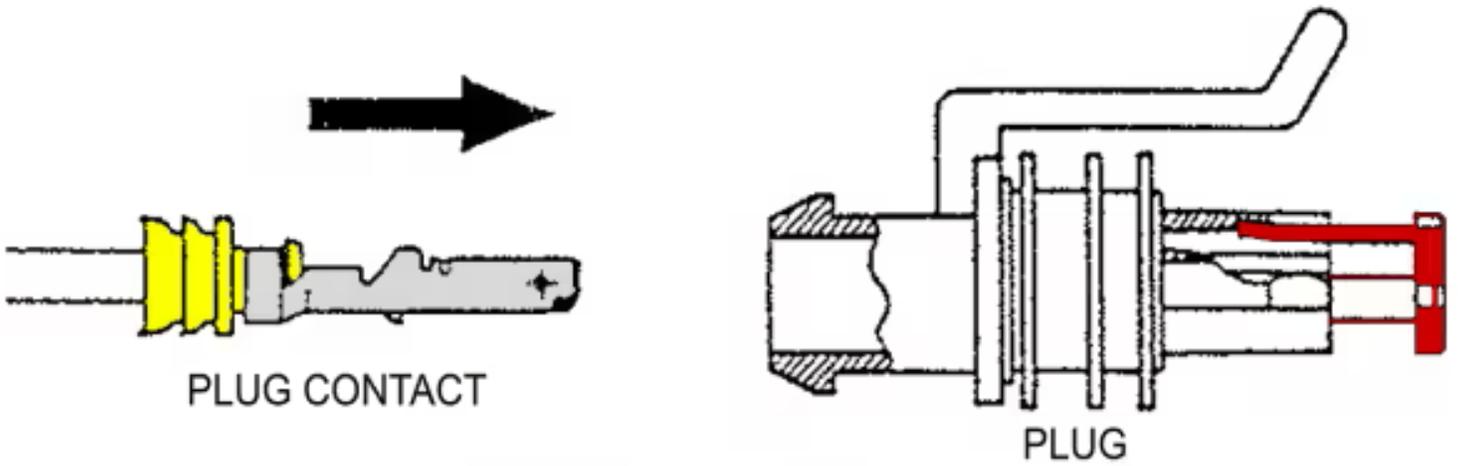

Here the **wire insulation and silicone seal** is being crimped using the **3.2 position** on the crimper.

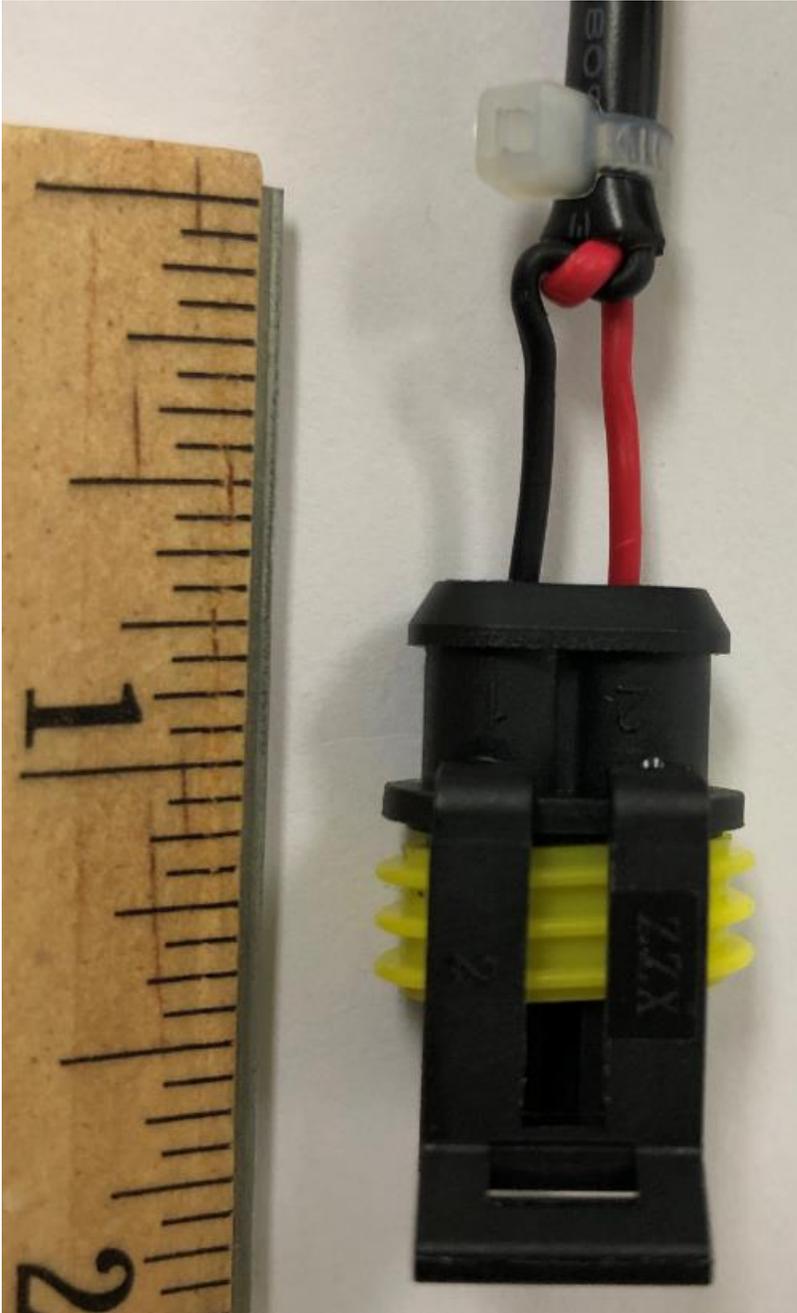

This is the result of the

1) insert the terminals into the shell. There should be a click when they lock in place and they should stay in place with a slight tug on a wire. Note the orientation of the tab contact and the cap housing.

2) Secure a cable tie just above the knot as shown

3) As done with the Cap Housing install the Plug Housing in the proper shell. Ensure the cable tie is inside the shell.
